

**Hoechst**

This panel shows a fluorescence microscopy image of a cell culture. The nuclei are stained with Hoechst, appearing as bright blue spots against a dark background. The cells are scattered across the field of view. A small white scale bar is visible in the bottom right corner.

**SOX17**

This panel shows a fluorescence microscopy image of the same cell culture. The SOX17 protein is stained in magenta, highlighting its localization within the cells. The staining is more widespread than the Hoechst signal, showing both nuclear and cytoplasmic/membrane localization in many cells. A small white scale bar is visible in the bottom right corner.
